

Economy Submersible Level Transmitter HSL100

Introduction

Based the principle that hydrostatic pressure increases with the liquid depth, HSL100 uses a submersible pressure sensor to measure the static pressure of the liquid column above the sensor, which is proportional to the liquid level, allowing for accurate determination of the liquid height in a tank or vessel.

Please choose from 0...5 bar.

HSL100 works based on the principle that hydrostatic pressure increases with the liquid depth, the pressure is proportional to the liquid level. For water, 1 bar is 10m water column.
